Science in the Cloud, 2019

Pandas, What is it?

A software library written for the Python for data manipulation and analysis. In particular, it offers data structures and operations for manipulating numerical tables and time series

Pandas, The DataFrame

The primary pandas data structure.

Two-dimensional size-mutable, heterogeneous tabular data structure with labeled axes (rows and columns). Arithmetic operations align on both row and column labels. Can be thought of as a dict-like container for Series objects.

Pandas, First Steps

Let's create a simple data set, and see what Pandas can do.

```
import pandas as pd
import numpy as np
import matplotlib.pyplot as plt
```

Pandas, First Steps

Let's create a simple data set, and see what Pandas can do.

```
s = pd.Series([1,3,5,np.nan,6,8])  
s
```

Pandas, First Steps

Let's create a simple data set, and see what Pandas can do.

```
dates = pd.date_range('20180101', periods=6)  
dates
```

Pandas, First Steps

Let's create a simple data set, and see what Pandas can do.

```
df = pd.DataFrame(np.random.randn(6,4),  
                  index=dates, columns=list('ABCD'))  
df
```

Pandas, First Steps

Let's create a simple data set, and see what Pandas can do.

```
df2 = pd.DataFrame({ 'A' : 1., 'B' :  
    pd.Timestamp('20130102'), 'C' :  
    pd.Series(1,index=list(range(4)),dtype='float32'), 'D' :  
    np.array([3] * 4,dtype='int32'), 'E' :  
    pd.Categorical(["test","train","test","train"]), 'F' :  
    'foo' })
```

df2

Pandas, Viewing Data

Some common/useful functions

```
df.head()  
df.tail(3)  
df.index  
df.columns  
df.values  
df.describe()  
df.T  
df.sort_index(axis=1, ascending=False)  
df.sort_values(by='B')
```

Pandas, Selecting Data by Label

Some common/useful functions

```
df['A']  
df[0:3]  
df['20130102':'20130104']  
df.loc[dates[0]]  
df.loc[:,['A','B']]  
df.loc['20130102':'20130104',['A','B']]  
df.loc['20130102',['A','B']]  
df.loc[dates[0],'A']
```

Pandas, Selecting Data by Position

Some common/useful functions

```
df.iloc[3]
df.iloc[3:5,0:2]
df.iloc[[1,2,4],[0,2]]
df.iloc[1:3,: ]
df.iloc[:,1:3]
df.iloc[1,1]
df.iat[1,1]
```

Pandas, CSV Files

manipulating CSV files.

```
ts = pd.Series(np.random.randn(1000), index=pd.date_range('1/1/2000',  
    periods=1000))  
ts = ts.cumsum()  ## cumulative sum  
  
df = pd.DataFrame(np.random.randn(1000, 4), index=ts.index, columns=['A',  
    'B', 'C', 'D'])  
df = df.cumsum()  
  
df.to_csv('foo.csv')  
pd.read_csv('foo.csv')
```

Pandas, CSV Files

filtering data made easy... .query

```
df = pd.DataFrame(np.random.randn(1000, 4), index=ts.index, columns=['A',  
'B', 'C', 'D'])
```

```
df = df.cumsum()
```

```
df.query('A > 10 & B > 10')
```

Pandas, CSV Files

just because... return of lambda

```
df = pd.DataFrame(np.random.randn(1000, 4), index=ts.index, columns=['A',  
'B', 'C', 'D'])
```

```
df = df.cumsum()
```

```
df.loc[lambda df: df.B > 10] ## What do you think this does?
```

Pandas, Joining

Dataset 1

```
raw_data = {
    'subject_id': ['1', '2', '3', '4', '5'],
    'first_name': ['Alex', 'Amy', 'Allen', 'Alice', 'Ayoung'],
    'last_name': ['Anderson', 'Ackerman', 'Ali', 'Aoni', 'Atiches']}
df_a = pd.DataFrame(raw_data, columns = ['subject_id', 'first_name',
    'last_name'])
```

df_a

Pandas, Joining

Dataset 2

```
raw_data = {  
    'subject_id': ['4', '5', '6', '7', '8'],  
    'first_name': ['Billy', 'Brian', 'Bran', 'Bryce', 'Betty'],  
    'last_name': ['Bonder', 'Black', 'Balwner', 'Brice', 'Btisan']}
```

```
df_b = pd.DataFrame(raw_data, columns = ['subject_id', 'first_name',  
    'last_name'])
```

```
df_b
```

Pandas, Joining

Dataset 3

```
raw_data = {
    'subject_id': ['1', '2', '3', '4', '5', '7', '8', '9', '10', '11'],
    'test_id': [51, 15, 15, 61, 16, 14, 15, 1, 61, 16]}

df_n = pd.DataFrame(raw_data, columns = ['subject_id','test_id'])

df_n
```

Pandas, Joining

Joining along rows

```
df_new = pd.concat([df_a, df_b])  
df_new
```

Pandas, Joining

Joining along columns

```
pd.concat([df_a, df_b], axis=1)
```

Pandas, Joining

Merging

```
pd.merge(df_new, df_n, on='subject_id')
```

Pandas, Joining

Merging, Outer Join

```
pd.merge(df_a, df_b, on='subject_id', how='outer')
```

Pandas, Joining

Merging, Inner Join

```
pd.merge(df_a, df_b, on='subject_id', how='inner')
```

Pandas, Joining

Merging, Right Join

```
pd.merge(df_a, df_b, on='subject_id', how='right')
```

Pandas, Joining

Merging, Left Join

```
pd.merge(df_a, df_b, on='subject_id', how='left')
```

Pandas, Summary of Features

Pandas allow for:

- Boolean Indexing
- Statistical Operations
- Histogramming
- Merging Data
- SQL Style Joins
- SQL Style Appends
- SQL Style Grouping
- Reshaping
- Pivoting
- and more!
